FastAPI Framework Knowledge

ComicCraft – AI Comic Story Creator using Gemini Models

Overview

FastAPI is the backend framework used by ComicCraft to manage server-side operations and route handling. It receives form or JSON input, connects the AI-generation functions, renders templates, and supports comic export.

Role in ComicCraft

The project defines routes in routes.py for form-based and JSON-based comic generation, image testing, and export confirmation. FastAPI also provides interactive API documentation.

Important routes

/ loads index.html; /generate handles form submission and comic generation; /generate-comic/json accepts JSON and returns layout/PDF information; /export-success confirms export; /test-image tests image generation.

Input handling

HTML form values such as story prompt, character name, setting, tone, and art style are captured with Form(...) parameters. JSON input is validated using the PromptRequest Pydantic schema.

Workflow

The /generate flow calls generate_outline(), generate_story(), generate_image(), build_comic_layout(), and save_pdf() in sequence.
