HTML, CSS, and Jinja2 Template Skills

ComicCraft – AI Comic Story Creator using Gemini Models

HTML

HTML provides the structure of the ComicCraft interface. index.html collects the story prompt, character name, setting, story tone, and art style.

CSS

CSS is used to create centered layouts, styled buttons, hover effects, padded input/result panels, box shadows, rounded corners, and responsive presentation.

Jinja2

FastAPI uses Jinja2Templates to dynamically render HTML. The project uses index.html, comic_preview.html, and export_success.html.

Dynamic binding

comic_preview.html displays panel number, title, image, scene description, captions, and narration. Jinja2 loops through the layout with syntax such as {% for panel in layout %}.

Template flow

The / route renders index.html, /generate renders comic_preview.html, and /export-success renders export_success.html.

Source basis: uploaded ComicCraft project document.
